

Appendix 2: Map of evidence and evidence based guidance for North Wales early intervention and prevention (Social Services & Wellbeing Act implementation)

Purpose: The purpose of the map is to assist with the population needs assessment required under the Social Services and Wellbeing (Wales) Act 2014. It is an update of the map of evidence and evidence based guidance, originally produced in 2016. The map will support the development of a framework of core functions that contribute toward preventing or delaying the need for managed care. Whilst the map has been produced in response to a request from the Betsi Cadwaladr University Health Board (BCUHB) Public Health Team, it may also be of interest to other local public health teams across Wales.

Method: This map (the sources) was developed using literature searches to identify high level sources such as published systematic reviews or evidence syntheses/statements/guidelines from recognised (for example, expert body) sources providing an evidence base for the identified interventions. Where there were no recent systematic reviews, primary studies have been included. Some voluntary sector publications and conference reports which are particularly relevant to the intervention and/or applicable to Wales have been included. It should be noted that these reports reflect the opinion of the authors and have not been subject to peer review. This map is an update of an initial search conducted in 2016.

Note on Interpretation/use of sources: Most sources will have considered the effectiveness of the identified intervention. However, each source should be consulted for details of the population and the specific outcomes that have been considered. Evidence maps are useful for providing structured access to evidence, particularly where there are a large number of robust secondary sources on a particular topic. The sources included in this map have not been selected on the basis of an evidence review following systematic review principles and an explicit methodology, set out *a priori* in a protocol, which is transparent, repeatable and which aims to minimise bias. This means that these sources

Gwasanaeth Tystiolaeth

Evidence Service

should not be considered to provide an objective, reliable synthesis of the totality of the available evidence base. No critical appraisal of the included sources has been conducted; systematic reviews or evidence reviews following systematic review principles would normally include critical appraisal of their primary sources but the reliability of any other sources remains unchecked. Primary, as well as secondary sources, have been included. Limitations, both within the studies and of the study designs themselves, have been noted where applicable.

Acknowledgement The map is an update of a map of evidence and evidence based guidance produced in 2016. Any additional interventions included in this evidence map (2021) have been identified in consultation with the North Wales PNA / MSR Steering group members. The role of the Steering Group, Alwen Salisbury, Siwan Jones and Professor Robert Atenstaedt from the BCUHB Public Health Team is acknowledged in the production of this map.

		evicted post-pandemic. Black, Asian and minority ethnic (BAME) renters, renters
		with children, lower-income renters, and renters who have lost income during the
		pandemic, are disproportionately struggling.
		Key recommendations of the report include:

Intervention	Source	Brief summary of source
		 Immediately provide support for renters in arrears in England by increasing the funding for Discretionary Housing Payments, and amending how they are administered. Protect people from harm: re-align Local Housing Allowance rates with local rents and don't remove the £20 a week Universal Credit, (ended October 2021). The Government must also ensure people who are still receiving 'legacy' benefits, many of whom are disabled or carers, are no longer excluded from this vital improvement to support. Build more homes for social rent. It should be noted that this is a commissioned charity report. It has not been subject to peer review and possible bias has not been taken into account.
	Smith, B. (2019). <i>Delivering Affordable</i> <i>Housing in Wales in Challenging Times.</i> Welsh Policy and Politics in Unprecedented Times. Wales Centre for Public Policy/WISERD Conference. 24th May 2019: Swansea. Available <u>here</u> .	This conference presentation was delivered by Bob Smith, Honorary Senior Research Fellow, School of Geography and Planning, Cardiff University. It was delivered at the Wales Centre for Public Policy/WISERD Conference in May 2019. The presentation highlights key issues for housing affordability in Wales. These include: problems of widening house price/earnings ratio; variable demand in differing areas; long-term shifts in housing tenure; rising rents and other issues. The presentation discusses some Welsh policy responses, such as the Welsh Housing Bond and Help-to-Buy scheme.

Intervention	Source	Brief summary of source
		The presentation includes key recommendations of an independent review of
		affordable housing supply. These include:
		• Implementing a five year social sector rent policy (2020-21 onwards)
		Better understanding of housing needs (at different spatial scales)
		Consolidation/simplification of standards for all new build affordable
		homes.
		It should be noted that this is a conference speech, which might be considered
		expert opinion, as opposed to a systematic review testing interventions, which
		would undergo evidence grading.

	National Institute for Health and Care	This NICE guideline is for commissioners, managers and practitioners with
	Excellence. (2015). Dementia, disability	public health as part of their remit, working in the public, private and third sector
	and frailty in later life – mid-life	and the public.
	approaches to delay or prevent onset. NG16. London: NICE. Available <u>here</u> . The guidance is up to date.	The guideline covers mid-life approaches to delay or prevent the onset of dementia, disability and frailty in later life. Its' recommendations aim to increase the amount of time that people can be independent, healthy and active in later life.
		The key recommendations on promoting a healthy lifestyle to reduce the risk of or delay the onset of disability, dementia and frailty by helping people are:
		• •stop smoking
		• be more active
		• reduce alcohol consumption
		• •improve diet
		 •lose weight and maintain a healthy weight if necessary.
	National Institute for Health and Care	This guideline covers diagnosing and managing dementia (including Alzheimer's

	Consider group reminiscence therapy for people living with mild to moderate
	dementia.
	Consider cognitive rehabilitation or occupational therapy to support functional
	ability in people living with mild to moderate dementia.
	Do not offer acupuncture to treat dementia.
	Do not offer ginseng, vitamin E supplements, or herbal formulations to treat
	dementia.
	• Do not offer cognitive training to treat mild to moderate Alzheimer's disease.
	• Do not offer interpersonal therapy to treat the cognitive symptoms of mild to
	moderate Alzheimer's disease.
	Do not offer non-invasive brain stimulation (including transcranial magnetic
	stimulation) to treat mild to moderate Alzheimer's disease, except as part of a
	randomised controlled trial.
The Lancet Commissions. (2020).	This is a 2020 report from The Lancet journal detailing current evidence and
Dementia prevention, intervention, and	information about prevention, intervention, and care of dementia.
care: 2020 report of the Lancet	
	Some key messages:

Intervention	Source	Brief summary of source
	Commission. Volume 396, Issue 10248,	The Lancet add three further risk factors for dementia. They are: excessive
	P413-446. Available <u>here</u>	alcohol consumption, traumatic brain injury, and air pollution.
		• 12 modifiable risk factors account for around 40% of worldwide dementias,
		which consequently could theoretically be prevented or delayed.
		• Aim to maintain systolic BP of 130 mm Hg or less in midlife from around age
		40 years (antihypertensive treatment for hypertension is the only known
		effective preventive medication for dementia).
		Encourage use of hearing aids for hearing loss and reduce hearing loss by
		protection of ears from excessive noise exposure.
		Reduce exposure to air pollution and second-hand tobacco smoke.
		Prevent head injury.
		Limit alcohol use, as alcohol misuse and drinking more than 21 units weekly
		increase the risk of dementia.
		Avoid smoking uptake and support smoking cessation to stop smoking, as
		this reduces the risk of dementia even in later life.
		For those with dementia, recommendations are:
		Provide holistic post-diagnostic care
		Post-diagnostic care for people with dementia should address physical and
		mental health, social care, and support. Most people with dementia have
		other illnesses and might struggle to look after their health and this might
		result in potentially preventable hospitalisations.

Intervention	Source	Brief summary of source
		Manage neuropsychiatric symptoms
		It should be noted that this report is based on varied study designs, including systematic reviews, rather than a systematic review itself. Note should be taken as to the limitations discussed in the report, such as using global figures for dementia risk.
	Canadian Agency for Drugs and	This report reviews the clinical effectiveness and cost-effectiveness of sensory
	Technologies in Health. (2018). Sensory	rooms for patients with dementia in long-term care.
	Rooms for Patients with Dementia in Long-Term Care: Clinical and Cost-	Key findings:
	Effectiveness, and Guidelines. Ottawa: CADTH; 2018 Jul. (CADTH rapid response report: summary with critical appraisal). Available <u>here</u>	 Based on the evidence identified in this review, it is not possible to make a definitive conclusion regarding the effectiveness of sensory rooms compared to other treatment modalities for improving symptoms in individuals with dementia. Generally in the short term, there appeared to be some improvements with therapy using multisensory stimulation environment such as Snoezelen, however the improvements were not significantly different compared with other treatment modalities. No study assessing the cost-effectiveness of sensory rooms for patients with dementia in long-term care was identified. Two evidence-based guidelines recommended several non-pharmacological interventions for individuals with dementia, including multisensory stimulation environments.

Intervention	Source	Brief summary of source
		There are several limitations to this review, notably overlap between studies and
		that the majority of the studies were on older adults (age \geq 80 years), hence the
		generalisability of the findings to other age groups may not be appropriate.
	Livingston, G. et al. A systematic review	This review synthesised the evidence for clinical effectiveness and cost-
	of the effectiveness and cost-	effectiveness of non-pharmacological interventions for reducing agitation in
	effectiveness of sensory, psychological	dementia.
	and behavioural interventions for managing agitation in older adults with	Author's conclusions:
	dementia. Health Technology	Person-centred care, communication skills and DCM (all with supervision),
	Assessment 2014;18(39). Available here	sensory therapy activities, and structured music therapies reduce agitation
		in care-home dementia residents. Future interventions should change care
		home culture through staff training and permanently implement evidence-based
		treatments and evaluate health economics. There is a need for further work on
		interventions for agitation in people with dementia living in their own homes.
		The main limitation of this review was the study size of some included studies:
		there were only 33 reasonably sized (> 45 participants) randomised controlled
		trials, and lack of evidence means that the authors cannot comment on many
		interventions' effectiveness. There were no hospital studies and few studies in
		people's homes.

Intervention	Source	Brief summary of source
	Lai NM, et al. Animal-assisted therapy for	This review aimed to evaluate the efficacy and safety of animal-assisted therapy
	dementia. Cochrane Database of	for people with dementia.
	Systematic Reviews 2019, Issue 11. Art. No.: CD013243. DOI:	Authors' conclusions
	10.1002/14651858.CD013243.pub2.	The authors found low-certainty evidence that AAT (animal-assisted
	Available <u>here</u>	therapy) may slightly reduce depressive symptoms in people with
		dementia. They found no clear evidence that AAT affects other outcomes in this
		population, with the certainty in the evidence ranging from very-low to moderate
		depending on the outcome. The authors found no evidence on safety or effects
		on the animals. Therefore, clear conclusions cannot yet be drawn about the
		overall benefits and risks of AAT in people with dementia. Further well-
		conducted RCTs are needed to improve the certainty of the evidence.
	Fernandez, et al. Effect of doll therapy in	This review evaluated the effects of doll therapy on challenging behaviours
	managing challenging behaviors in	(including agitation and verbal or physical aggression) in people with dementia.
	people with dementia: a systematic review. JBI Database of Systematic	Results
	Reviews and Implementation Reports: August 2014 - Volume 12 - Issue 8 - p	Six studies were included in the review. Of the three studies that investigated the impact of doll therapy on agitation and aggressive behaviors among people with
	330-363 doi: 10.11124/jbisrir-2014-1646.	dementia, two reported an improvement in agitation and aggressive behaviors
	Available <u>here</u>	and one reported no statistically significant decrease (p=0.07) in aggressive
		behaviors among residents who used the dolls. In the only study that
		investigated positive behaviors, statistically significant improvements (p< 0.005)

Intervention	Source	Brief summary of source
		in positive behaviors from baseline (6.32 ± 4.13) to the three months follow-up
		(14.21 ± 9.86) were observed among residents who used the dolls. In addition,
		an increase in levels of positive activity among residents who used the dolls was
		reported in two other studies.
		Authors' conclusions
		There is limited evidence to support the use of doll therapy for
		management of agitation and aggressive behaviors among people with
		dementia. This treatment modality however has no side effects and provides a
		safe comfort measure for people with dementia.
	Noone, C, et al. (2020). Video calls for	This rapid review assesses the effectiveness of video calls for reducing social
	reducing social isolation and loneliness in	isolation and loneliness in older adults. The participants in the review had an

	here	
		Based on the findings of this review there is currently very uncertain
		evidence on the effectiveness of video call interventions to reduce
		loneliness in older adults. The evidence regarding the effectiveness of video
		calls for outcomes of symptoms of depression was very uncertain.

Intervention	Source	Brief summary of source
	Age UK (2018) All the Lonely People:	This report from Age UK focusses on further understanding loneliness among
	Loneliness in Later Life. London: Age UK.	people aged 50 and over. It includes sources from the Office for National
	Available <u>here</u>	Statistics and the English Longitudinal Study of Ageing.
		Key points of the report include:
		 Social activities are an essential component of successful approaches to tackling loneliness, but for many lonely people such activities are only effective when complemented by emotional and practical support to access them. Many neighbourhoods have a variety of social activities that people are either unaware of or unable to access, and that compete rather complement each other. Neighbourhoods that are welcoming, attractive, feel safe and have amenities for all residents can help prevent people from becoming lonely. Measuring loneliness requires using both a single-item direct loneliness question and an indirect scale; using only a direct question or an indirect scale will underestimate the prevalence of loneliness.
		It should be noted that this is a commissioned charity report. It has not been
		subject to peer review or considered the strength of evidence, and possible bias has not been taken into account.
Asset Based	National Institute for Health and Care	This guideline covers community engagement approaches to reduce health
Community	Excellence. (2016). Community	inequalities, ensure health and wellbeing initiatives are effective and help local

training &	This guidance is up to date.	
facilitation		 Overarching principles of good practice – what makes engagement more effective?
		 Developing collaborations and partnerships, approaches to encourage and support alliances between community members and statutory, community and voluntary organisations to meet local needs and priorities Involving people in peer and lay roles – how to identify and recruit people to represent local needs and priorities Making community engagement an integral part of health and wellbeing initiatives Making it as easy as possible for people to get involved.
	Brunton G et al. (2015). Review 2: Community engagement for health via coalitions, collaborations and partnerships. A systematic review and meta-analysis. London: EPPI-Centre. Available <u>here</u>	 This systematic review and meta-analysis undertaken to support the development of NICE guideline 44 looked at coalitions, collaborations and partnerships. It addressed the following questions How effective are community engagement approaches at improving health and wellbeing and reducing health inequalities?

Gwasanaeth Tystiolaeth

 Across disadvantaged groups, how effective are community engagement approaches at encouraging people to participate in activities to improve the health and wellbeing and realise their capabilities? What processes and methods facilitate the realisation of community and individual capabilities and assets amongst disadvantaged groups? Are there unintended consequences from adopting community engagement approaches? What processes identified in the literature are more aligned with effective interventions and which (if any) are more aligned with non-effective interventions? The review authors concluded that taken together, the findings suggest that community-led or community collaboration projects which design,
deliver and evaluate health interventions are associated with larger behavioural outcomes. Where coalitions, collaborations and partnerships w community members include the use of bidirectional communication, collective decision making and community member or professional training support for intervention provision, a higher extent of community engagement across the project's design, delivery and evaluation was also found. Effective configurati of engagement within collaborations and coalitions generally include peer or I delivery, and projects with a low extent of engagement were likely to be less

Intervention	Source	Brief summary of source
	Harrison, R et al. (2019). Asset-Based	This primary research- a qualitative study from researchers at four UK
	Community Development: Narratives,	universities- sought to better understand the mechanisms through which Asset-
	Practice, and Conditions of Possibility—A	Based Community Develpoment (ABCD) operates, and the environmental and

	Practitioners. SAGE Open. Volume: 9	effectiveness at improving health and well-being and reducing inequalities.
	issue: 1, DOI:/10.1177/2158244018823081. Available <u>here</u>	Interviews and focus groups were conducted with 25 people working in third sector and voluntary organizations to begin to improve understanding about ABCD approaches, how they are implemented, and how they are meeting the needs of disadvantaged populations. These individuals had local area knowledge of programs that follow an ABCD approach and which are currently running in the North West of England. Four overarching themes gave insight into the principles and practices of ABCD: Relationships and trust as mechanisms for change, Reciprocity and connectivity: "people not services," Accountability and reducing dependency, and a socially sustainable model. ABCD is likely to be most effective in supporting vulnerable people where building trust is mirrored by an institutional and relational environment that is trustworthy and facilitative of developing people's capabilities.

Intervention	Source	Brief summary of source
		It should be noted that this study is of qualitative design, a design which
		explores believes, experiences and attitudes and can be useful for generating
		hypotheses, rather than assessing the effectiveness of interventions.

Intervention	Source	Brief summary of source
	Newbigging, K et al. (2020). The	This primary research, conducted mainly by researchers from The University of
	contribution of the voluntary sector to	Birmingham, aimed to investigate the contribution of Voluntary Sector (VS)_
	mental health crisis care: a mixed-	organisations to mental health crisis care in England.
	methods study. Health Service Delivery Research; 8(29). Available here	 The VS has been conceptualised as a third 'terrain' of organisations between the state and market, comprising charities and community groups, underpinned by a sector ethos that typically values accessibility, self-organisation, service-user-defined outcomes, informality and relational-based approaches. Across this diverse range of organisations, there is a wide range of approaches and activities, including befriending. A mental health crisis is considered a biographical disruption. Voluntary sector organisations can make an important contribution, characterised by a socially oriented and relational approach. Five types of relevant voluntary sector organisations were identified: (1) crisis-specific, (2) general mental health, (3) population-focused, (4) life-event-focused and (5) general social and community voluntary sector organisations. These voluntary sector organisations provide a range of support and have specific expertise. The availability and access to voluntary sector organisations varies and inequalities were evident for rural communities; black, Asian and minority ethnic communities.

Intervention	Source	Brief summary of source
		A limitation of this study was that the survey response was low, reflecting the
		nature of voluntary sector organisations and demands on their time.
		It should be noted that this is a descriptive study, so evaluating outcomes from
		voluntary sector organisation support was beyond the scope of the study.
	Burroughs, H et al. (2019). Non-traditional	This feasibility study was designed to determine whether or not support workers
	support workers delivering a brief	(SWs) can be trained to deliver a community-based psychosocial intervention to
	psychosocial intervention for older people	older people with anxiety and/or depression.
	with anxiety and depression: the	
	NOTEPAD feasibility study. Health	Results:
	Service Delivery Research 2019; 7(25).	Recruitment (and retention) of the SWs was possible; the training, support
	Available <u>here</u>	materials and manual were acceptable to them, and they delivered the
		intervention as intended. Recruitment of practices from which to recruit patients
		was possible, but the recruitment target (100 patients) was not achieved, with 38
		older adults randomised. Retention at 4 months was 86%. The study was not
		powered to demonstrate differences in outcomes.
		Older people in the intervention arm found the sessions with SWs acceptable,
		although signposting to, and attending, groups was not valued by all
		participants. GPs recognised the need for additional care for older people with
		anxiety and depression, which they could not provide. Participation in the study
		did not have an impact on routine care, other than responding to the calls from

Intervention	Source	Brief summary of source
		the study team about risk of self-harm. GPs were not aware of the work done by
		SWs with patients.
		Conclusions:
		Support workers recruited from Age UK employees can be recruited and
		trained to deliver an intervention, based on the principles of behavioural
		activation (BA), to older people with anxiety and/or depression. The
		training and supervision model used in the study was acceptable to SWs,
		and the intervention was acceptable to older people.
		It should be noted that is is a feasibility study, designed to assess of the
		practicality of a proposed plan or method. A key limitation is that target
		recruitment was not achieved. The authors note that further development of
		recruitment strategies is needed before this intervention can be tested in a fully
		powered randomised controlled trial.
	Jopling, K and Jones, D. (2021). Lessons	This report was commissioned jointly by The Mercer's Company and
	from befriending in the time of Covid-19.	Independent Age, two charities.
	The Mercer's Company and Independent	
	Age. Available <u>here</u>	The report recommends that organisations involved in befriending should:
		• Carefully plan and manage their transition to a blended model
		• Put appropriate mental health support in place for volunteers and staff

Intervention	Source	Brief summary of source
		 • Build on their inclusion efforts and lessons from this period Organisations which fund befriending should: • Resource sufficient levels of staffing and support for volunteers
		 Recognise that organisations will be 'double running' for an extended period, and fund this transition process accordingly Support the organisations they fund to address common challenges such as transition, mental health and inclusion.
		It should be noted that this is a commissioned charity report. Methods used to produce it include interviews, online events and a survey Its methods are not transparent or reproducible. It has not been subject to peer review and possible bias has not been taken into account.
Breastfeeding	McFadden, A et al. (2017). Support for	This systematic review describes forms of breastfeeding support which have
peer support	healthy breastfeeding mothers with healthy term babies. Cochrane Database of Systematic Reviews. Issue 2. Art. No: CD001141. DOI: 10.1002/14651858.CD001141.pub5. Available <u>here</u>	 been evaluated in controlled studies, the timing of the interventions and the settings in which they have been used and to examine the effectiveness of different modes of offering similar supportive interventions. Results of the analyses continue to confirm that all forms of extra support analysed together showed a decrease in cessation of 'any breastfeeding', which includes partial and exclusive breastfeeding (moderate-quality evidence) and for stopping breastfeeding before four to six weeks (moderate-quality evidence).

Intervention	Source	Brief summary of source
		Authors' conclusions:
		When breastfeeding support is offered to women, the duration and exclusivity of breastfeeding is increased. Characteristics of effective support include: that it is offered as standard by trained personnel during antenatal or postnatal care, that it includes ongoing scheduled visits so that women can predict when support will be available, and that it is tailored to the setting and the needs of the population group.
		Support is likely to be more effective in settings with high initiation rates.
		Support may be offered either by professional or lay/peer supporters, or a combination of both.
		Strategies that rely mainly on face-to-face support are more likely to succeed with women practising exclusive breastfeeding.

		Carers should be actively identified to receive information about their rights.

Intervention	Source	Brief summary of source
	Liu Z, Sun YY, Zhong BL. (2018). Mindfulness-based stress reduction for family carers of people with dementia. Cochrane Database of Systematic Reviews. Issue 8. Art. No.: CD012791. DOI: 10.1002/14651858.CD012791.pub2. Available here	 Carer's assessments should be carried out by local authorities and social care organisations. Help carers stay in, enter or return to work, education and training Local authorities should ensure carers are kept regularly informed about available community services and other sources of support and advice and how to access them Training should be provided to enable carers to provide care safely Consider providing carers with psychosocial and psychoeducational support Provide support during changes to the caring role Provide support for carers during end of life care and after the person dies This systematic review aimed to assess the effectiveness of Mindfulness-based stress reduction (MBSR) in reducing the stress of family carers of people with dementia. Mindfulness-based stress reduction programmes were compared with either active controls (those matched for time and attention with MBSR, i.e. education, social support, or progressive muscle relaxation), or inactive controls (those not matched for time and attention with MBSR, i.e. self-help education or respite care). Compared with active controls, MBSR may reduce depressive symptoms of carers at the end of the intervention (low-quality evidence). Compared with

Intervention	Source	Brief summary of source
		 inactive controls, MBSR showed no clear evidence of any effect on depressive symptoms (low-quality evidence). In conclusion, low-quality evidence suggests that MBSR may reduce
Childcare	Christensen, CB et al. (2019). The effect	carers' depressive symptoms and anxiety, at least in the short term. The objective of this cluster randomised controlled study was to assess the
(breakfast clubs)	of introducing a free breakfast club on eating habits among students at	effect of a free breakfast club intervention on dietary habits among students at vocational schools.
	<i>vocational schools</i> . BMC Public Health. Volume 19, Article number: 369. Available <u>here</u>	The study included students (n = 318) from four vocational schools in Denm Food frequency questionnaires were used to measure eating habits at base first, and second follow-up, after 7 and 14 weeks respectively, in a clustered randomized controlled intervention of four months.
		The authors concluded that provision of free breakfast at vocational schools can improve the dietary quality of breakfast and decrease breakfast skipping. However, the sustainability of the intervention is a critical issue that needs to be further studied and addressed.
		Limitations: Due to time and financial constraints, the questionnaire was not validated, an omission that carries the risk of the questionnaire not measuring what was intended.

Intervention	Source	Brief summary of source
		Danish vocational and educational programmes are in general gender
		segregated. The gender segregation is illustrated in this study, in which the
		majority of participants were male (95.6%). Because the sample does not
		resemble the general population or other types of educational programmes (e.g.,
		health care and pedagogy), this is a study limitation that limits its external
		validity.
	Franklin, J et al. (2021). The economic	Magic Breakfast is a registered charity delivering healthy breakfasts, targeted at
	cost-effectiveness of the Magic Breakfast	schools with a high proportion of disadvantaged children, and providing support
	model of school breakfast provision.	to their schools.
	London: Pro Bono Economics. Available here	Pro Bono Economics aims to support charities by help them measure, understand and better articulate their impact, influence and inform policy and make best use of their data. This study looks at longer-term economic benefits, and what these academic impacts mean for reduced costs incurred for special educational needs, truancy and exclusions as well as improvements in earnings from employment up to the age of 60.
		The study finds that providing disadvantaged pupils completing Key Stage 1 in England/Primary 3 in Scotland with one year's supply of school breakfast provision could generate long-term economic benefits in excess of £9,000 per child.

Intervention	Source	Brief summary of source
		A limitation of this study is that its assessment is based on an evaluation of the
		impact of the programme over a single year, specifically for those children
		completing Key Stage 1 of primary school. As such, the analysis may not
		provide an accurate assessment of the cost-effectiveness of the programme
		over multiple years or for children in different age groups.
		It should be noted that this is a commissioned charity report, which is not peer
		reviewed and does not take into account possible bias.
Childcare	Melhuish, E. (2016). <i>Longitudinal</i>	This article examines longitudinal data to consider how research evidence has
	research and early years policy	contributed to early years policy change in the last two decades.
	development in the UK. ICEP 10, 3. hiips://doi.org/10.1186/s40723-016-0019- 1. Available <u>here</u>	Early childhood education and care (ECEC) in the UK is a mixed economy, in that it is partly financed and organised by the central and local government, partly by private individuals and organisations, and partly by voluntary organisations (e.g., community groups, charities).
		Key findings include:
		When children entered primary school, the EPPSE study (Sammons et al. 2002, 2003) found that:
		• Two to three years of high-quality early years education can provide up to 8 months of developmental advantage in literacy-related outcomes

Intervention	Source	Brief summary of source
		 compared to children who enter school with no pre-school experience, with similar effects on other cognitive and social outcomes. While high-quality ECEC experience provided a boost, the greatest predictor of success was the home learning environment (HLE), i.e., the learning opportunities provided at home had the largest effect on child outcomes. The quality of ECEC is correlated with staff qualifications, and higher quality was related to better outcomes for children. It should be noted that this is an observational study, rather than a randomised controlled trial. It does not seek to uncover cause and effect relationships but rather find correlations and possible links between data and outcomes. This study has a single author; it has not considered limitations to the study or possible bias.
	Er, V. (2018). Association of diet in nurseries and physical activity with zBMI in 2-4-year olds in England: a cross-sectional study. BMC public health18.1: 1262. Available <u>here</u>	The study aimed to examine the relationships of diet in childcare settings and daily physical activity (PA) of preschoolers with body mass index z-score (z-BMI). It looked at 150 children aged 2-4-years participating in the Nutrition and Physical Activity Self-Assessment for Child Care (NAP SACC) UK study to examine the associations of their diet in childcare settings and daily PA with z-BMI.

Intervention	Source	Brief summary of source
		Key results:
		Among children who consumed one main meal or snack at childcare, 34.4% and 74.3% met the standards on fruits and vegetables and high sugar or fat snacks, respectively. Adherence to Children's Food Trust (CFT) guidelines was not associated with zBMI. Only 11.4% of children met recommended UK guidelines
		of three hours per day of physical activity.
		The authors concluded that the low proportion of children meeting the standards on fruits and vegetables and high sugar or fat snacks and recommended physical activity levels highlight the need for more work to support nurseries and parents to improve preschool children's diet and activity.
		Limitations of study:
		Parents were asked to report their children's food intake using a home food diary but there was a low response rate and many filled in the diary on a different date from the nursery observation. Therefore, the authors were not able to estimate the daily dietary intake of children and compare their dietary intake by setting (nursery vs. home).
		Unlike dietary indices such as the Healthy Eating Index (HEI), Diet Quality Index (DQI) or the Mediterranean Diet Score (MDS), the NAP SACC UK Nutrition Best

Intervention	Source	Brief summary of source
		Practice Standard has not been validated and may not be suitable for examining
		the relationship between diet quality and zBMI.
		It should be noted that this is a cross-sectional study: associations between an outcome and factors identified through such studies may be thought of as potential correlations, however further research would be required to determine the nature of any relationship.
Education	Morgan, AT, Murray, E, Liégeois, FJ.	This systematic review aimed to assess the efficacy of interventions targeting
support	(2018). Interventions for childhood	speech and language in children and adolescents with Childhood Apraxia of
(SALT)	apraxia of speech. Cochrane Database of	Speech (CAS) as delivered by speech and language pathologists/therapists.
	Systematic Reviews. Issue 5. Art. No.: CD006278. DOI: 10.1002/14651858.CD006278.pub3. Available <u>here</u>	This review includes only one randomised controlled trial (RCT). This study recruited 26 children aged 4 to 12 years, with mild to moderate CAS of unknown cause, and compared two interventions: the Nuffield Dyspraxia Programme-3 (NDP-3); and the Rapid Syllable Transitions Treatment (ReST).
		Both the NDP-3 and ReST therapies demonstrated improvement at one month post-treatment. For three outcomes the effect was marginally greater for NDP-3 than ReST: accuracy of production on treated words; speech production consistency, and accuracy of connected speech.
		The authors concluded that there is limited evidence that, when delivered intensively, both NDP-3 and ReST may effect improvement in word accuracy in 4- to 12-year-old children with CAS, measured by the accuracy

Intervention	Source	Brief summary of source
		of production on treated and non-treated words, speech production
		consistency and the accuracy of connected speech.
		The authors judged all core outcome domains to be low risk of bias. They downgraded the quality of the evidence by one level to moderate due to
		imprecision, given that only one RCT was identified.
	Brignell, A et al. (2018). Communication interventions for autism spectrum disorder in minimally verbal children. Cochrane Database of Systematic Reviews. Issue 11. Art. No.: CD012324. DOI: 10.1002/14651858.CD012324.pub2. Available here.	 This systematic review sought to assess the effects of communication interventions for ASD in minimally verbal children. This review includes two RCTs (154 children aged 32 months to 11 years) of communication interventions for Autism Spectrum Disorder (ASD) in minimally verbal children compared with a control group (treatment as usual). The authors conclude that there is limited evidence that verbally based and Augmentative Communication in minimally verbal children with ASD. A substantial number of studies have investigated communication interventions for minimally verbal children with ASD, yet only two studies met inclusion criteria for this review, and the authors considered the overall quality of the evidence to be very low.
	Pennington, L et al. (2016). Speech	This systematic assessed whether any speech and language therapy
	therapy for children with dysarthria	intervention aimed at improving the speech of children with dysarthria is more
	acquired before three years of age.	effective in increasing children's speech intelligibility or communicative

Intervention	Source	Brief summary of source
	Cochrane Database of Systematic	participation than no intervention at all , and to compare the efficacy of individual
	Reviews. Issue 7. Art. No.: CD006937.	types of speech language therapy in improving the speech intelligibility or
	DOI: 10.1002/14651858.CD006937.pub3.	communicative participation of children with dysarthria.
	Available <u>here</u>	No randomised controlled trials or group studies were identified.
		This review found no evidence from randomised trials of the effectiveness
		of speech and language therapy interventions to improve the speech of
		children with early acquired dysarthria. Rigorous, fully powered randomised
		controlled trials are needed to investigate if the positive changes in children's
		speech observed in phase I and phase II studies are generalisable to the
		population of children with early acquired dysarthria served by speech and
		language therapy services.
Supported	Suijkerbuijk, YB et al. (2017).	This systematic review assesses the comparative effectiveness of various types
employment	Interventions for obtaining and	of vocational rehabilitation interventions and to rank these interventions
	maintaining employment in adults with	according to their effectiveness to facilitate competitive employment in adults
	severe mental illness, a network meta-	with severe mental illness.
	analysis. Cochrane Database of Systematic Reviews. Issue 9. Art. No.: CD011867. DOI: 10.1002/14651858.CD011867.pub2. Available here	The authors concluded that supported employment and augmented supported employment were the most effective interventions for people with severe mental illness in terms of obtaining and maintaining employment, based on both the direct comparison analysis and the network meta-analysis, without increasing the risk of adverse events.

Intervention	Source	Brief summary of source
		These results are based on moderate- to low-quality evidence, meaning that
		future studies with lower risk of bias could change these results.
		Augmented supported employment may be slightly more effective compared to
		supported employment alone. However, this difference was small, based on the
		direct comparison analysis, and further decreased with the network meta-
		analysis, meaning that this difference should be interpreted cautiously.
	Fong, C.J. et al. (2021). Interventions for	The objective of this review is to determine the effectiveness of employment
	improving employment outcomes for	interventions in securing and maintaining employment for adults and transition-
	persons with autism spectrum disorders:	age youth with Autism Spectrum Disorder (ASD), updating two reviews by
	a systematic review update. Campbell	Westbrook et al.
	Systematic Reviews. Volume 17, Issue 3. DOI:10.1002/cl2.1185. Available here	The systematic review update identified three studies that evaluated employment outcomes for interventions for individuals with ASD. All three studies identified in the review suggest that vocation-focused programs may have positive impacts on the employment outcomes for individuals with ASD. Wehman et al. indicated that participants in Project SEARCH had higher employment rates than control participants at both 9-month and 1-year follow-up time points. Adding autism spectrum disorder supports, Project SEARCH in Wehman et al.'s study also demonstrated higher employment rates for treatment participants than control participants at postgraduation, 3-month follow-up, and 12-month follow-up. Smith et al. found that virtual reality job interview training

Intervention	Source	Brief summary of source
		was able to increase the number of job offers treatment participants received
		compared to control participants.
		The authors concluded that given that prior reviews did not identify
		interventions with actual employment outcomes, the more recent
		emergence of evaluations of such programs is encouraging. This suggests
		that there is a growing body of evidence regarding interventions to enhance the
		employment outcomes for individuals with ASD but also greater need to conduct
		rigorous trials of vocation-based interventions for individuals with ASD that
		measure employment outcomes.
		The authors note that because of the few studies in the review, and the relatively
		small sample sizes, readers should not overly generalise the findings from the
		review.
Employment	Price, S and Shaw, H. (2020). What	This summary provides an overview of the direction of evidence answering the
(NEET)	works to improve participation in good	question "What works to improve participation in work in order to improve health
	work? Summary of systematic evidence	and reduce health inequalities?"
	mapping. Cardiff: Public Health Wales	
	NHS Trust. Available here	The systematic mapping summary found that a number of interventions
		may help to get people into work. They include:
		Apprenticeships
		Welfare to work programmes
		Active labour market programmes

Gwasanaeth Tystiolaeth

Intervention	Source	Brief summary of source
		Exhaustion of unemployment benefits
		Policies to increase access to finance e.g. loan subsidies or guarantees
		Employment interventions for cancer survivors
		 Supported employment for those with severe mental illness
		Access to grants, loans and subsidies to support innovation
		Mental health interventions for those with mental health problems.
		A number of interventions may help to keep people in work. They include:
		• For people with musculoskeletal conditions, individually focused interventions
		to support return to work, and workplace focused interventions to reduce time
		to return to work
		 Employment interventions to help cancer survivors stay in work and
		multidisciplinary interventions to help people with cancer stay in or return to work
		Problem solving therapies to reduce sickness absence in people with
		adjustment disorder
		Work directed interventions added to clinical interventions for people with
		depression to reduce sickness absence.
		It should be noted that this is not a systematic review and does not consider the
		quality of the evidence. The full evidence maps (available here) should be

Intervention	Source	Brief summary of source
		consulted and full evidence reviews read to inform decisions. Bear in mind that
		the interventions may not be relevant to every setting or population.
	Learning and Work Institute. (2020).	The primary focus of the review was on interventions implemented from 2010 to
	Evidence review: What works to support	2020 that aim to improve attainment and employment, progression and
	15 to 24-year olds at risk of becoming	engagement.
	<i>NEET?</i> Leicester: Learning and Work Institute. Available <u>here</u>	The quality and nature of the evidence in this review has been considered, and the authors present studies with robust causal evidence in order to identify
		approaches which have been effective in supporting young people across
		attainment and employment, progress and engagement outcomes. They
		include:
		 Multiple interventions and 'wrap around' approaches work effectively for disadvantaged learners to improve attainment and job prospects.
		Traineeships, supported internships and apprenticeship programmes can
		deliver positive employment and earnings outcomes for young people at risk of becoming NEET.
		Basic skills support can improve progress and reduce the risk of NEET.
		Access to work experience can result in long-term employment and earning
		gains.
		 Mentoring and counselling can effectively support pupils at risk of becoming NEET.

Arsyllfa lechyd CYMRU NHS WALES Arsyllfa lechyd Cyhoeddus Cymru Public Health Wales Observatory

Intervention	Source	Brief summary of source
		 Multiple interventions which target motivational and confidence skills building can improve engagement, but flexibility of intervention delivery is key. One-to-one and tailored engagement can support disengaged young people to return to education, training and employment. Learning Communities can help 16-18 year olds at key transition points to increase their educational engagement. Financial incentives support educational progress, but further testing in a UK context is required.
Equipment - telecare	Gathercole, R et al. (2021). Assistive technology and telecare to maintain independent living at home for people with dementia: the ATTILA RCT. Health Technology Assessment, 25(19). Available <u>here</u>	 This randomised controlled trial aimed to establish whether or not assistive technology and telecare assessments and interventions extend the time that people with dementia can continue to live independently at home and whether or not they are cost-effective. Caregiver burden, the quality of life of caregivers and of people with dementia and whether or not assistive technology and telecare reduce safety risks were also investigated. The authors' conclusions are:
		A full package of assistive technology and telecare did not increase the length of time that participants with dementia remained in the community, and nor did it decrease caregiver burden, depression or anxiety, relative to a basic package of assistive technology and telecare.

source
stive technology and telecare package did not increase
and social care or societal costs.
e-years based on participants' EuroQol-5 Dimensions
onses were reduced in the intervention group compared with
groups did not differ in the number of quality-adjusted life-
e proxy-rated EuroQol-5 Dimensions questionnaire.
ing data at follow-up precluded investigation of longer-term
nology on caregiver outcomes. Furthermore, loss to follow-up
ta set was non-random, introducing some degree of bias. This
t among some caregivers was partly due to the care recipient
ntial care or dying. Furthermore, power analysis was
study primary outcome (time to institutionalisation), rather than
comes. Therefore, it is possible that the analyses were
owered.
n Sciences Centre Home Safety Program (HSP) provides
ucation, a safety video, and home safety checklist to all first-
e reduction of childhood home injuries. The objective of this
ate the HSP for the prevention of home injuries in children up

Intervention	Source	Brief summary of source
		The HSP was evaluated through a mixed-mode survey using both Internet and
		telephone surveys.
		Removing hazards, supervision, and installing safety devices are key facilitators in the reduction of home injuries. Parents found the HSP useful to identify hazards, learn new strategies, build confidence, and provide safety products. Initial finding suggests that the program is effective in reducing home injuries in children up to 2 years of age.
		This is primary, mixed methods research, involving both qualitative (surveys) and quantitative (statistical analysis) methods.
		The authors note several limitations to the study, notably only 20% of first-time parents responded, which may limit the generalisability of the survey results, favouring a more safety conscious group of parents.
	Wang, Y et al. (2020). Varying Effect of a Randomized Toddler Home Safety Promotion Intervention Trial by Initial Home Safety Problems. Maternal & Child Health Journal, Apr2020; 24(4): 432- 438.DOI: 10.1007/s10995-019-02845-x. Available here	The study examined whether effective safety interventions targeting low-income families of toddlers varied by initial home safety problems. This study found that the effects of the safety promotion intervention among low-income families with toddlers varied by initial home safety problems. Among families with multiple home safety problems, the intervention resulted in relatively large effects, whereas the effects for families with no/few home safety problems were small and not significant.

Intervention	Source	Brief summary of source
		 Information on smoking should be integrated into the curriculum. For example, classroom discussions could be relevant when teaching biology, chemistry, citizenship and maths. Anti-smoking activities should be delivered as part of personal, social, health and economic (PHSE) and other activities related to Healthy Schools or Healthy Further Education status. Anti-smoking activities should aim to develop decision-making skills and include strategies for enhancing self-esteem. Parents and carers should be encouraged to get involved and students could be trained to lead some of these programmes. All staff involved in smoking prevention should be trained to do so. Educational establishments should work in partnership with outside agencies to design, deliver, monitor and evaluate smoking prevention activities.

		 Children and young people aged 10 to 15 years – assessing their ability to consent, judging their alcohol use, discussion and referral to specialist services. Young people aged 16 and 17 years – identification, offering motivational support or referral to specialist services. Adults – screening, brief advice, motivational support or referral.
	McGovern, R et al. (2021). <i>Effectiveness</i> of psychosocial interventions for reducing parental substance misuse. Cochrane Database of Systematic Reviews. Issue 3. Art. No.: CD012823. DOI: 10.1002/14651858.CD012823.pub2. Available here	This systematic review assessed the effectiveness of psychosocial interventions in reducing parental substance use (alcohol and/or illicit drugs, excluding tobacco). The authors found moderate-quality evidence that psychosocial interventions probably reduce the frequency at which parents use alcohol and drugs. Integrated psychosocial interventions which combine parenting skills interventions with a substance use component may show the most promise. Whilst it appears that mothers may benefit less than fathers from intervention, caution is advised in the interpretation of this evidence, as the interventions provided to mothers alone typically did not address their substance use and other related needs. The authors found low-quality evidence from few studies that interventions involving children are not beneficial.

		Non-brief interventions: Family Focused Therapy (Fam) may be most
		effective in reducing alcohol use (low SoE).
		More research is needed to identify other effective intensive behavioural
		interventions for alcohol use disorder.
		Intensive interventions did not appear to decrease cannabis use (low SoE).
		Some interventions (Cognitive Behavioural Therapy (CBT), CBT+MI, and
		CBT+MI+ Contingency Management (CM)) were associated with increased cannabis use (low SoE).
		Both MI and CBT reduce combined alcohol and other drug use (low SoE).

Intervention	Source	Brief summary of source
		Combined CBT+MI reduces illicit drug use (low SoE).
Healthy lifestyle support (sexual health)	 National Institute for Health and Care Excellence. (2007). Sexually transmitted infections and under 18s conceptions prevention. PH3. London: NICE. Available here. This guidance is up to date (checked in 2018 and will be updated). 	 Recommendations in this NICE guidance include the following: Assess people's risk of having a sexually transmitted infection (STI), when the opportunity arises. For example, this could happen when someone attends for contraception, or to register as a new patient. Offer advice to people at high risk of an STI in a structured discussion, or arrange for them to see someone who is trained to give this type of advice. The discussion should cover ways to help people reduce the risks. Help people with an STI to get their partners tested and treated. This might involve referring the person to a specialist. People with STIs and their partners should receive information about the infection they have. This guidance is intended for professionals responsible for, or who work in, sexual health services including general practitioners and professionals working in contraceptive services, genitourinary medicine and school clinics.
	National Institute for Health and Care Excellence. (2014). <i>Contraceptive</i> <i>services for under 25s.</i> PH51. London: NICE. Available <u>here</u> .	This NICE guidance is for NHS and other commissioners, managers and practitioners who have a direct or indirect role in, and responsibility for, contraceptive services. This includes those working in local authorities, education and the wider public, private, voluntary and community sectors. It may also be of interest to young people, their parents and carers and other members of the public. The recommendations include advice on:

		Overall, the low-certainty evidence that was identified makes it difficult to infer
		which interventions were best, with exception of invitational interventions, where
		there appeared to be more reliable evidence.

Gwasanaeth Tystiolaeth

Intervention	Source	Brief summary of source
Healthy	Langford R et al. (2014). The WHO health	The review authors found that interventions using the WHO Health Promoting
schools	promoting school framework for	Schools (HPS) approach were able to reduce students' body mass index (BMI),
support	improving the health and well-being of	increase physical activity and fitness levels, improve fruit and vegetable
	students and their academic	consumption, decrease cigarette use, and reduce reports of being bullied.
	achievement. Cochrane Database	However, they found little evidence of an effect on BMI when age and gender
	Systematic Reviews. Issue 4. Art. No:	were taken into account and no evidence of effectiveness on fat intake, alcohol
	CD008958. doi:	and drug use, mental health, violence, and bullying others.
	10.1002/14651858.CD008958.pub2.	
	Available <u>here</u>	The review authors did not have enough data to draw conclusions about the
		effectiveness of the HPS approach for sexual health, hand-washing, cycle-
		helmet use, eating disorders, sun protection, oral health or academic outcomes.
		Few studies discussed whether the health promotion activities, or the collection
		of data relating to these, could have caused any harm to the students involved.
		The review authors concluded that the results of this review provide
		evidence for the effectiveness of some interventions based on the HPS
		framework for improving certain health outcomes but not others. More
		well-designed research is required to establish the effectiveness of this
		approach for other health topics and academic achievement.
	Neil-Sztramko, SE et al. (2021). School-	The purpose of this systematic review update is to summarise the evidence on
	based physical activity programs for	effectiveness of school-based interventions in increasing moderate to vigorous
	promoting physical activity and fitness in	
	children and adolescents aged 6 to 18.	

Intervention	Source	Brief summary of source
	Cochrane Database of Systematic	physical activity and improving fitness among children and adolescents 6 to 18
	Reviews. Issue 9. Art. No.: CD007651.	years of age.
	DOI: 10.1002/14651858.CD007651.pub3. Available <u>here</u>	Results show that school-based physical activity interventions probably result in little to no increase in time engaged in moderate to vigorous physical activity and may lead to little to no decrease in sedentary behaviour (low-certainty evidence). School-based physical activity interventions may improve physical fitness reported as maximal oxygen uptake (low-certainty evidence). School-based physical activity interventions may result in a very small decrease in BMI z-scores (low- certainty evidence) and may not impact BMI expressed as kg/m ² (low- certainty evidence).
		Given the variability of results and the overall small effects, school staff and public health professionals must give the matter considerable thought before implementing school-based physical activity interventions. Given the heterogeneity of effects, the risk of bias, and findings that the magnitude of effect is generally small, results should be interpreted cautiously.
Looked after	National Institute for Health and Care	This NICE guidance is for all those who have a role in promoting the quality of

	 What Works for Children's Social Care. (2019). Educational interventions for looked after children and young people. Cardiff: The Children's Social Care 	This is an evidence summary, based on a systematic review examining educational interventions for looked-after children and young people. Summary of key points:

Brief summary of source
 Brief summary of source While the systematic review reports findings from randomised controlled trials, differences in the quality of the conduct and reporting of studies limited the extent to which effectiveness could be determined. Five papers reported three randomised controlled trials of Teach Your Children Well, which is an intervention that includes direct tuition on reading, language and maths skills and behaviour management techniques. Mixed findings were reported for Teach Your Children Well and academic skills. When children were taught individually by foster carers, improvements were reported for sentence comprehension and maths skills. At group level, variation was noted between 25- and 30-week delivery. At 25 weeks, improvements were reported for reading and spelling while at 30-weeks, improvements were reported for reading, spelling and maths skills. Educational interventions aimed at pre-school children appeared to have a positive effect on the development of academic skills, including early literacy skills. Where interventions were not associated with improvements in academic skills it was suggested that looked after children and young people may have a range of needs which require specialist trained providers. The review highlights the need for theoretically-driven educational interventions and evaluations looking at which interventions work for different

Gwasanaeth Tystiolaeth

Intervention	Source	Brief summary of source
		Improvements are needed in the methodological quality of study design so that conclusions can be drawn on the effectiveness and development of educational interventions.
Parenting support	Robling, M et al. (2021). The Family Nurse Partnership to reduce maltreatment and improve child health and development in young children: the BB:2 6 routine data- linkage follow-up to earlier RCT. Public Health Research; 9 (2). Available here	The objectives of this follow-up study were to establish the medium-term effectiveness of the Family Nurse Partnership in reducing maltreatment and improving maternal health (second pregnancies) and child health, developmental and educational outcomes (e.g. early educational attendance, school readiness). The intervention comprised up to a maximum of 64 home visits by specially trained family nurses from early pregnancy until the firstborn child was 2 years of age, plus usually provided health and social care support. The comparator was usual care alone. The authors concluded that there is no observable benefit of the programme for maltreatment or maternal outcomes, but it does generate advantages in school readiness and attainment at Key Stage 1.
	Barlow, J et al (2016). Group-based parent training programmes for improving emotional and behavioural adjustment in young children. Cochrane Database of Systematic Reviews, Issue 8. Art. No.:	This systematic review examined whether group-based parenting programmes are effective in improving the emotional and behavioural adjustment of young children (maximum mean age of three years and 11 months. It also assessed whether parenting programmes are effective in the primary prevention of emotional and behavioural problems.

Intervention	Source	Brief summary of source
	CD003680. DOI:	The findings of this review, which relate to the broad group of universal
	10.1002/14651858.CD003680.pub3.	and at-risk (targeted) children and parents, provide tentative support for
	Available <u>here</u>	the use of group-based parenting programmes to improve the overall
		emotional and behavioural adjustment of children with a maximum mean
		age of three years and 11 months, in the short-term.
		There is a need for more research regarding the role that these programmes
		might play in the primary prevention of both emotional and behavioural
		problems, and their long-term effectiveness.
	O'Hara, L et al. (2019). Video feedback	This systematic review assessed the effects of video feedback on parental

	Edinburgh: NHS Health Scotland.	The review authors concluded that the cooking skills courses and
	Available <u>here</u>	activities included in the review (most of which were funded via
		Community and Food Health Scotland) appear from course feedback to
		have been engaging and enjoyable experiences for those who participated.
		The review authors said that notwithstanding the limitations in the outcome data,
		participants who have completed course feedback and evaluation forms
		consistently self-reported short-term improvements in confidence, knowledge,

Intervention	Source	Brief summary of source
		intentions to change and in some instances behaviour change. Many of the
		strategies were aimed primarily at 'non cooking outcomes' or mediators of future
		cooking outcomes such as self-efficacy or food's role in social interaction.
		The causal linkages between these mediators and cooking outcomes require
		further testing. The review authors stated that there was some good evaluation
		and reporting practice but there was a lack of clarity and specificity in many of
		the plans and implementation reports.
	Segrott, J. et al. (2017). Implementation	The purpose of this paper is to examine how a mobile classroom (Cooking Bus)
	of a Cooking Bus intervention to support	sought to strengthen connections between schools and cooking, and drawing on
	cooking in schools in Wales, UK. Health	the concept of the sociotechnical network, theorise the interactions between the
	Education, 117(3), pp. 234-251.	Bus and school contexts.
	Available <u>here</u>	The authors found that the Cooking Bus forged connections with schools
		through aligning intervention and schools' goals, focussing on pupils'
		cooking skills, training teachers and contributing to schools' existing
		cooking-related activities. The Bus expanded its sociotechnical network
		through post-visit integration of cooking activities within schools, particularly
		teachers' use of intervention cooking kits.
		It should be noted that this is a qualitative study, using questionnaires, a design
		which explores believes, experiences and attitudes and can be useful for
		generating hypotheses, rather than assessing the effectiveness of interventions.

chronic mental illness)	Issue 1. Art. No: CD000381. doi: 10.1002/14651858.CD000381.pub3. Available <u>here</u>	The review authors concluded that currently there is no good evidence to suggest life skills programmes are effective for people with chronic mental illnesses.
	Lean, M. et al. (2019). Self-management interventions for people with severe mental illness: Systematic review and meta-analysis. The British Journal of Psychiatry, 214 (5), 260-268. doi:10.1192/bjp.2019.54. Available here	This systematic review evaluated the effectiveness of self-management interventions for adults with severe mental illness (SMI). The authors found that there is evidence that the provision of self- management interventions alongside standard care improves outcomes for people with SMI. Self-management interventions should form part of the standard package of care provided to people with SMI and should be prioritised in guidelines: research on best methods of implementing such interventions in routine practice is needed. A particular limitation of this study was that although all studies included in this review were randomised controlled trials (RCTs), there was variation in the reporting of sequence generation, allocation concealment and blinding of participants and personnel was not always consistent. This increases possible risk of bias.

		wide range of partners and stakeholders in local health and justice systems,
		including local authorities and health professionals.
	Rivas, C et al. (2019). A realist review of	This systematic review assesses advocacy interventions for intimate partner
	which advocacy interventions work for	abuse in women, in terms of which interventions work for whom, why and in
	which abused women under what	what circumstances.
	<i>circumstances</i> . Cochrane Database of Systematic Reviews, Issue 6. Art. No.: CD013135. DOI: 10.1002/14651858.CD013135.pub2. Available <u>here</u>	The authors found moderate and high confidence in evidence for the importance of considering both women's vulnerabilities and intersectionalities and the trade-offs of abuse-related decisions in the contexts of individual women's lives. Decisions should consider the risks to the woman's safety from the abuse. Whether actions resulting from advocacy increase or decrease abuse depends on contextual factors (e.g. severity and type of abuse), and the outcomes the particular advocacy intervention is designed to address (e.g. increasing successful court orders versus decreasing depression).
		The authors have low confidence in evidence regarding the significance of physical dependencies, being pregnant or having children. There were links between setting (high confidence), and potentially also theoretical underpinnings of interventions, type, duration and intensity of advocacy, advocate discipline and outcomes (moderate and low confidence). A good therapeutic alliance was important (high confidence); this alliance might be improved when advocates are

Intervention	Source	Brief summary of source
		matched with abused women on ethnicity or abuse experience, exercise cultural
		humility, and remove structural barriers to resource access by marginalised
		women.
		The review authors identified significant challenges for advocates in inter-
		organisational working, vicarious traumatisation, and lack of clarity on how much
l		support to give a woman (moderate and high confidence). To work effectively,
		advocates need ongoing training, role clarity, access to resources, and peer and
		institutional support.

	Witt, KG et al (2021). Psychosocial	This systematic review assessed the effects of psychosocial interventions for
	interventions for self-harm in adults.	self-harm (SH) compared to comparison types of care (e.g. treatment-as-usual,
	Cochrane Database of Systematic	routine psychiatric care, enhanced usual care, active comparator) for adults
	Reviews. Issue 4. Art. No.: CD013668.	(aged 18 years or older) who engage in SH.
	DOI: 10.1002/14651858.CD013668.pub2. Available <u>here</u>	Overall, there were significant methodological limitations across the trials included in this review. Given the moderate or very low quality of the available evidence, there is only uncertain evidence regarding a number of psychosocial interventions for adults who engage in SH. Psychosocial therapy based on Cognitive Behavioural Therapy (CBT) approaches may result in fewer individuals repeating SH at longer follow-up time points, although no such effect was found at the post-intervention assessment and the quality of evidence, according to the GRADE criteria, was low.

Intervention	Source	Brief summary of source
		Given findings in single trials, or trials by the same author group, both
		Mindfulness Based Therapy (MBT) and group-based emotion regulation therapy
		should be further developed and evaluated in adults. Dialectical Behaviour
		Therapy (DBT) may also lead to a reduction in frequency of SH. Other
		interventions were mostly evaluated in single trials of moderate to very low
		quality such that the evidence relating to the use of these interventions is
		inconclusive at present.
	Witt, KG et al (2021). Interventions for	This systematic review assessed the effects of psychosocial interventions or
	self-harm in children and adolescents.	pharmacological agents or natural products for SH compared to comparison
	Cochrane Database of Systematic	types of care (e.g. treatment-as-usual, routine psychiatric care, enhanced usual

	DOI: 10.1002/14651858.CD013667.pub2.	combination of these) for children and adolescents (up to 18 years of age) who
	Available <u>here</u>	engage in SH.
		Given the moderate or very low quality of the available evidence, and the small number of trials identified, there is only uncertain evidence
		regarding a number of psychosocial interventions in children and
		adolescents who engage in SH. Further evaluation of DBT-A is warranted.
		Given the evidence for its benefit in adults who engage in SH, individual CBT-
		based psychotherapy should also be further developed and evaluated in children and adolescents.

Intervention	Source	Brief summary of source
Skills	O'Donnell, R et al. (2020). The impact of	The aim of this systematic scoping review was to examine the characteristics of
development	transition interventions for young people	interventions that support young peoples' transition from care and into
- support for	leaving care: a review of the Australian	independence, delivered in Australia, and to evaluate their impact.
young people to develop independent living skills	<i>evidence</i> . International Journal of Adolescence and Youth. Vol.25, No 1, 1076- 1088.DOI.org/10.1080/02673843.2020.18 42216. Available <u>here</u>	The authors found that transitional programmes that provide long-term, consistent, and integrated coordinated support that is tailored to an individual's needs can foster improved independent living outcomes post- transition. However, to date, current interventions are less successful in targeting and improving health outcomes.
		Given the adverse health outcomes for young people transitioning from care, it is essential that such programmes are adapted or developed to increase emphasis on facilitating improvements in health outcomes (e.g., mental, physical, and social health), in addition to fostering outcomes that are indicative of independent living (e.g., housing).
		The quality assessment for the 11 studies is as follows: a total of 8/11 studies (73%) were of high quality, and the remaining three studies were of low quality. All three quantitative studies were low in quality due to a high rate of nonresponse bias, a lack of valid, reliable, or pre-tested measurements, and statistical analyses were not often described nor justified. Contrastingly, all qualitative studies were of high quality due to adequate data collection methods and well supported interpretation of results. The mixed methods studies were of high quality as they provided an adequate rationale for adopting a mixed method

Intervention	Source	Brief summary of source
		design to address the research question, and integrated their interpretation of
		both qualitative and quantitative components into the results.
		The authors note some limitations of this study, notably small sample sizes and
		studies limited to one state within Australia.
		As the study was not conducted in the UK, its generalisability to a Wales/UK context is uncertain.
	Everson-Hock, E. et al. (2011).	This systematic review aimed to synthesize evidence on the effectiveness of
	Supporting the transition of looked-after	transition support services (TSSs) that are delivered towards the end of care for
	young people to independent living: a	looked-after young people (LAYP) on their adult outcomes, including education,
	systematic review of interventions and	employment, substance misuse, criminal and offending behaviour, parenthood,
	adult outcomes. Child: care, health and	housing and homelessness and health.
	development, 37(6), pp. 767-79. Available here	Taken as a whole, the available literature suggests that no real
		conclusions on the effectiveness of TSSs can be made at this stage due to
		mixed evidence in terms of positive, negative and neutral impact on
		outcomes and varying study quality, and because few formal evaluations
		of existing TSSs have been conducted. Most were based on specific agency
		programmes and therefore have been small-scale, exploratory, non-random,
		retrospective and without comparison groups. Thus, although useful for
		programme planning, their utility for demonstrating programme effectiveness is
		highly limited.

Intervention	Source	Brief summary of source
Telecare and telehealth	Totten, AM et al. (2019). <i>Telehealth for</i> <i>Acute and Chronic Care Consultations</i> . Comparative Effectiveness Review No. 216. AHRQ Publication No. 19-EHC012- EF. Rockville, MD: Agency for Healthcare Research and Quality. Available here	The aim of this systematic review was to identify and summarize the available evidence on the effectiveness of telehealth consultations, and to explore using decision modelling techniques to supplement the review. The authors concluded that in general, the evidence indicates that telehealth consultations are effective in improving outcomes or providing services, with no difference in outcomes; however, the evidence is stronger for some applications, and less strong or insufficient for others. However, as specific details about the implementation of telehealth consultations and the environment were rarely reported, it is difficult to assess generalisability. Exploring the use of a cost model underscored that the economic impact of telehealth consultations depends on the perspective used in the analysis. The increase in both interest and investment in telehealth suggests the need to develop a research agenda that emphasizes rigor and focuses on standardized outcome comparisons that can inform policy and practice decisions.
	Karlsen, C et al. (2017). <i>Experiences of</i> <i>community-dwelling older adults with the</i> <i>use of telecare in home care services: a</i> <i>qualitative systematic review</i> , JBI Database of Systematic Reviews and Implementation Reports: Volume 15 - Issue 12 - p 2913-2980 doi:	The aim of this review was to identify and synthesize the best available qualitative evidence of community-dwelling older adults' experience with the use of telecare in home care services. The authors found that experiences with the use of telecare are diverse. Findings indicate telecare systems can promote safety and security to age in place that is a wish of many older adults. However, "one size does not

Volunteering	Stuart, J., et al. (2020) The Impacts of Volunteering on the Subjective Wellbeing of Volunteers: A Rapid Evidence Assessment. What Works Centre for Wellbeing and Spirit of 2012. Available here	 This rapid evidence assessment (REA) examines what is known about the impacts of volunteering on the subjective wellbeing of volunteers. The review aims to support the work of practitioners, policy makers and funders in their design and delivery of volunteering opportunities and programmes. Key findings: The impacts of volunteering on subjective wellbeing: Most of the evidence on the impacts of volunteering on the subjective wellbeing of volunteers points to a positive association between the two, including improved life satisfaction, increased happiness and reduced symptoms of depression. The authors cannot definitively conclude, however, that volunteering categorically enhances subjective wellbeing. A small number of studies claim reverse causality – higher wellbeing makes individuals more likely to volunteer rather than volunteering causing higher wellbeing. A number of studies use advanced statistical strategies and control for a range of factors that might affect subjective wellbeing, providing us with more

Intervention	Source	Brief summary of source
		 confidence that volunteering leads to enhanced subjective wellbeing for volunteers. This does not mean that volunteering always leads to improved wellbeing. The evidence tentatively suggests that some volunteering activities can lead to anxiety, stress or burnout. There is a significant gap in the evidence on the negative effects of volunteering on the wellbeing of volunteers.
	Husk, K. et al. (2016). Participation in environmental enhancement and conservation activities for health and well- being in adults: a review of quantitative and qualitative evidence. Cochrane Database of Systematic Reviews. Issue 5. Art. No.: CD010351. DOI: 10.1002/14651858.CD010351.pub2. Available here	This systematic review assesses the health and well-being impacts on adults following participation in environmental enhancement and conservation activities (EECA). The authors concluded that there is little quantitative evidence of positive or negative health and well-being benefits from participating in EECA. However, the qualitative research showed high levels of perceived benefit among participants. Quantitative evidence resulted from study designs with high risk of bias and qualitative evidence lacked reporting detail. The majority of included studies were programme evaluations, conducted internally or funded by the provider.
